SUBJECT INDEX

Actin
  development and 17, 18
  from various species 20, 21
  isoforms 11
  –myosin interaction 11, 21
  on ATPase activity 6
  properties 10
α-Actinin isoforms 13
Alcohol dehydrogenase
  horse liver
    folding and association steps 185
    reconstitution 191
      ligand effects on 212
  yeast, reconstitution 191, 193
Aldolase
  quaternary structure variations 180
  rabbit muscle
    reconstitution 191, 193, 194
    reversible denaturation 136
  Staphylococcus aureus monomeric
      class I 180, 194
    reversible denaturation 175
Amino acid
  sequences and protein structure 145–148
  solvent access in proteins 148
cAMP-dependent catabolite gene activator protein,
    interaction with DNA 59, 60
Antibodies
  monoclonal D1.3 model 41, 42
  structure and properties 39
Antigen
  –antibody
    complexes 39–42
    interactions and conformational changes 121, 122
  cell surface mapping 67
  cross-linking of 81
  variable domains 39
Apoferritin
  assembly pathway 205
  biosynthesis 204
  reconstitution 206
  subunits 205
Aspartate aminotransferase active site 215
Aspartate transcarbamoyl transferase (ATCase)
  assembly
    kinetics 204
    scheme 204, 220
    thermodynamic parameters 203
  association reactions 203
  reconstitution pattern 202
Aspartokinase-homoserine dehydrogenase (AK-HDH)
  allosteric functions 196
  bifunctionality 196, 197
  evolutionary development 197
  folding reactions 196, 220
ATPase of isomyosins 4
  actin on 6
  during development 14, 16
  hormones on 20
  in fish 20
  in old age 17
  muscle stimulation and 19
  subfragment-1 6

Bacteriophage
  λ
    protein assembly 208
    repressors, DNA interaction 57
    cro-DNA model 58
  M13 coat protein 106
  P22 *see* Tail spike protein
  T4 protein assembly 208
Bacteriorhodopsin FRET measurements 71
Basic pancreatic trypsin inhibitor (BPTI)
  –chymotrypsin complex 34
  folding studies 158, 159, 161, 167, 219
  genetic modification 222
  hydrophobicity profile 149
  structure, energy minimization and 151, 153, 154
  tertiary structure 133
  –trypsin complex 33, 34, 44, 54

C-protein isoforms 10
  development and 18
Cardiac muscle
  myofibrillar proteins of 23
  myosins 7
    development and 16
    functional overloading and 19
    species differences 8, 9
Cell surface components, topography of 66, 67
  advantages of FRET studies 75, 76
Chymotrypsin
  –BPTI complex, model 34
  –ovomucoid complex, model 35
Collagen reconstitution 189
Computer studies of macromolecule interactions *see*
    Protein–protein interactions
Concanavalin A cell binding 72–75, 81
γII Crystallin
  reversible denaturation 175, 176
  structural domains 174
Cytochrome b_{562} tertiary structure 133
Cytochrome C
  –cytochrome b_5 complex 36, 37
  –cytochrome C-peroxidase complex 37, 38
  –flavodoxin complex 38, 39
  folding 167, 213
  –oxidoreductase complexes 35
  –peroxidase complex 37, 38
  tertiary structure 133

Dehydrogenases *see* individual enzymes
5,5′-Dithiobis 2-nitrobenzoic acid (DTNB) on
    myosins 5
DNA
  –*cro* complex 57
  long intronic segments 133
  –protein interactions
    β-ribbon model 56
    CAP 59, 60
    distortion during 60
    lac fragment 59
    modelling principles 55
    phage repressors 57

Elastase–ovomucoid complex, model 35
Enzymes *see also* Proteins
  multienzyme complexes 205
  reactivation in protein association studies 179, 183, 192
  structure–function relationships 215
  substrate trapping 142
Erythrocyte membrane FRET mesurements 72
Escherichia coli outer membrane *see also* Proteins in *E. coli*
  genes
    chromosomal location 97
    secA 96, 99, 107
    secB 99
    secY/prlA 97–99, 100, 107, 109
    suppressor mutations 99
    table of 92
  proteins 91
    assembly 94–100
    assembly mechanism 104–108
    export model 109
    in vitro studies 108
    localization 101–104
    synthesis and assembly 100, 101
  structure 89–91

Fast skeletal muscles isomyosins 5
Fatty acid synthetase multienzyme dissociation 205, 206
Flavodoxin–cytochrome C complex 38, 39
Fluorescence dyes in membrane potential measurements 78
Fluorescence resonance energy transfer (FRET)
  flow cytometric energy transfer
    evaluation 75, 76
    theory, 73–75
  measurements in liposomes 70–72
  measurements in living cell membranes 72
  membrane components measurements, table of 67
  theory 69

β-Galactosidase (*E. coli*)
  complementation 195
  reconstitution 194
  polymerisation on catalysis 221
Gene expression, contractile protein expression and 21
Globular proteins *see* Protein structure
Glutamate dehydrogenase
  hexameric unit 215
  reconstitution properties 200
Gluteraldehyde fixation in protein association studies 180, 192
Glyceraldehyde-3-phosphate dehydrogenase (yeast)
  active site 215
  cold inactivation 182, 211
  reconstitution 191, 193
    ligand-induced acceleration of 211

Hemoglobin
  allosteric mechanism
    coupling quaternary and tertiary structures 49–52
    docking algorithm 45, 47
    quaternary structure change 48
  FRET measurements 71
  –S arrangement in fibres 42, 43
Hormones on contractile proteins 20

Immunoglobulin domains and folding 39, 40, 133
Isoenzymes definition 2

Isomyosins
  as markers of muscle physiology 3
  ATPase activity differences 4, 6, 9
  atrial 8
  cardiac development and 16
  cardiac overload and 19
  from fast skeletal muscles 5, 6
  heavy chain specificity 6, 8
  hormonal effects 20
  hyperfast 6
  light chain differences 4, 5
  3-methyl-histidine in 4
  role of 7
  ventricular 3, 7–10
Isoproteins
  characterisation 2, 3
  definition 2

α-Keto acid dehydrogenases from different sources 206

α-Lactalbumin structural domains 172
Lactate dehydrogenase (LDH)
  D-LDH
    folding and association steps 185
    reconstitution properties 190
  3D structure 135
  H_4
    hybrids 192, 214
    reconstitution 191
  M_4
    comparison of native with proteolytic dimers 216, 217
    fragments 214
    hybrids 214
    phosphate binding 210
    reconstitution 140, 160, 190–193
  reconstitution 189–191
  subunit interactions 135
  tertiary structure 133
  tetrameric isoenzymes 190–193, 212, 214
Ligand action in protein association 209
  cofactors 210
  specificity 213
Liposomes, FRET measurements in 70
T-Lymphocytes
  channels in 80, 81
  mitogens on 77, 80
  potential changes in membranes 79–82
  surface receptor sites 68, 73
Lysozyme
  antibodies 40–42
  domains 133, 172
  homology between T_4 and egg-white 172
  hydrophobicity profile 149
  reversible denaturation 136

Malate dehydrogenase folding 160
Membrane
  liposome, FRET measurements 71, 72
  living cell, FRET measurements 72
  plasma
    antigen proximity measurements 66
      blocking test 67
      capping phenomenon 67
      E.M. studies 68
      fluorescent tags 69
      lactoperoxidase catalysis 68
    lymphocyte, potential changes in 79–82

potential as measure of membrane dynamics 76
measurement techniques 77
pharmacological agents and 81
potential sensitive fluorescent probes 78, 82
structure
historical summary 65
of *E. coli* 90
Methotrexate on membrane transport 213
3-Methyl-histidine in myosin 4, 14
Mitogens on lymphocytes 77, 80
Muscle
activity modification of 18–20
development and protein changes 13–18
innervation on 18
Mutations in *E. coli* 99
Myeloma
MPC 11 cells, co-translational IgG folding in 122
proteins, complexes 40
Myoglobin structural fluctuations 142, 143
Myosins *see also* Isomyosins
–actin interaction 11, 21
changes during development 14–17
hybrid 7
in skeletal muscle 3
innervation and 18
HMC genes 7
of various species 21
schematic representation 4
tissue specificity 10

NAD-dependent dehydrogenases, reconstitution and isoenzymic forms 184–187

Octopine dehydrogenase
denaturation–renaturation studies 177, 178
structural domains 175, 176, 214

Penicillinase (β-lactamase) structural domains 173, 182
Peptides
identical in unrelated proteins 147
penta, conformation 144, 146
Phosphoglycerate kinase (PGK)
reconstitution 193
structural domains 172
Phosphoglycerate mutase (PGM)
quaternary structure variations 180
reconstitution 194
Phosphorylcholine complexes 40
Polypeptides
backbone 128
helices 137, 138
nascent chain folding 134
regular structures in 130, 144, 147
Porins in *E. coli* outer membrane 92, 100
Proline isomerization, protein folding and 161–166
Protein
–lipid complex in membranes 71
–nucleic acid interactions 54–60
β-ribbon model 55, 56
CAP 59, 60
lac 59
phage repressor-DNA 57
–protein interactions
antigen-antibody 39–42
automated computation 42
docking algorithm 44–47
ellipsoid approximation 51–53
other algorithms 53, 54
conformational energy calculations 31
cytochrome C 35–39
interactive computer graphics 32
models of macromolecular recognition 30
molecular surface representations 33
serine proteases and proteinase inhibitors 33–35
Protein association
definition 120
experimental approaches 157, 179
denaturation conditions 181
fixation of intermediates 180
–folding correlation 181
quantitative analyses 179, 180
quaternary structure variations 180
recovery of functional state 179
solvent conditions 180
ligand action 209
cofactors 210
specificity 213
reconstitution
mechanism 183
of structured intermediates 181
biological function and 183
enzyme regulation and 182
high dilution 182
high hydrostatic pressure 182
kinetic approach 183
low temperature 181
stabilization 182
specific systems (*see also* individual proteins) 184
assembly requirements 207
dehydrogenases comparison 184
dimers 185
multimers 200
tetramers 189
trimers 187
structure and 149, 155
wrong aggregation and 140, 178, 221
Protein folding
–association correlation 181
code of 123, 128
consensus pathway 219
definitions 120
denaturation
renaturation and 119, 123
reversible 136
experimental approaches 157
hierarchical condensation 220
in vivo and *in vitro* 120–123, 221
kinetic aspects 155, 161–165, 169
mechanism of 125
multi-domain 171
AK-HDHI 177
γII crystallin 174
α-lactalbumin 172
lysozyme 172
octopine dehydrogenase 175
penicillinase 173
phosphoglycerate kinase 172
staphylococcal aldolase 175
thermolysin 173
optimum reconstitution conditions 127
single chain 156
single domain
BPTI 158, 159, 161
conjugated systems 170
conservation of topology 166
fragments 167
homologous 166
proline isomerization and 161–166
reduction, reoxidation and 157–161
ribonuclease 159–165, 167–171

size of folding units 218
small proteins 219
specificity and subunit recognition 126
Protein structure
algorithms and 144
computer-aided predictions 150
energy minimization and 151–155
from amino acid sequence data 145
globular
internal motions in 152
topologies 133
heirarchy 127, 128
aggregates 139
denatured state 134–138
domains 132, 145
flexibility 142
multiple states 140
native state 138
polypeptide backbone 128
quaternary 134, 144
regular structures in 130
renatured state 138–144
secondary 129, 145
supersecondary 131–133, 145
tertiary 131
topologies 132
hydrophobicity and 146–150
kinetic aspects 155
molecular dynamics and 152
packing, docking and association 149
prediction possibilities from folding 222
ribonuclease variations 164
solvent effects 155
statistical analysis 145
Proteins
assembly
genetically determined morphopoiesis 208
intrinsic form determination 208
vectoral cotranscriptional 209
contractile
A-filament
C-protein 10
myosin 3–10
development and 13
I-filament
actin 10
α-actinin 13
troponin complex 12
tropomyosin 11
increased muscle activity and 18–20
innervation and 18
isoforms of 2, 22
gene expression and 21
of insect flight muscle 21
evolution 134
in *E. coli* outer membrane
COOH-terminus 104
deletions 103
export model 109–111
gene fusion and 102, 107
genetic loci for 97
hydrophobicity plots 93
iron on synthesis 91
NH_2-terminal signal sequence 95, 101, 103, 105
OmpA sequence and structure 94, 104
prokaryotic secretion 95
SecA 96, 107
SecB 99
SecY/prlA 97–99, 107, 109
synthesis and assembly 100, 104
LamB 101, 103–105, 108
OmpA 101, 103–105, 109
OmpF 100–103
TonA 101, 104
table of 92
translocation
co-translational 106
energy requirement 108
in vitro systems study 108
post-translational 106
polypeptide structure on 107
principles 94
structure–function relationships 215
turnover and function 143
Pyridoxal 5′-phosphate (PLP) as coenzyme for TSase 197, 198
Pyruvate dehydrogenase (PDH) complexes
reactivation kinetics 207
reconstitution 191, 212
resolution 206

Ribonuclease
folding 159–161, 167–170, 219
glycosylated 170
proline isomerization and 161–165
fragments 167–170
hydrophobicity profile 149
reversible denaturation 136
sequence variations 164
Ribosomal proteins 50S *E. coli* assembly map 209, 210
A-RNA β-ribbon fitting 55

Serine proteases interaction with proteinase inhibitors 33–35
Skeletal muscle
development and 14–18
fibre classification 3
myofibrillar proteins of 23
Soybean trypsin inhibitor tertiary structure 133
Staphylococcal aldolase *see* Aldolase

Tail spike protein (TSP)
efficiency of assembly 221
folding and association 188, 208, 215
Thermolysin
structural domains 173
cleavage sites and 174
tertiary structure 133
Thyroid state and myosins 20
Tobacco mosaic virus (TMV) protein
polymerization kinetics 208
quaternary structure 142, 144, 180
α-N-Trimethylamine in myosins 21
Triose phosphate isomerase (TIM)
reconstitution 191
tertiary structure 133
Tropomyosin
isoforms 11, 12, 22, 23
development and 17
electrical stimulation and 19
innervation and 18
subunits 11
Troponin complex
components of 12, 22, 23
development and 17
Trypsin
–BPTI complex, model 33, 34, 44, 54
analysis of contacts 47, 48

inhibitor binding 142
–OMJPQ3 complex, model details 36
–ovomucoid complex, model 35
–STI complex, model 34
Tryptophan synthase (TSase) of *E. coli*
association of β-subunits 185
fragmentation study 198
kinetic mechanism 198–200
reaction catalysed 198
reconstitution 191, 199
structure-function relationship 197
transformation 222

UDP glucose dehydrogenase reconstitution, kinetic scheme 201

Virus-membrane attachment 68, 69
Vitamin K complexes 40
